STRATEGIC DECISION MAKING IN DUAL PTAB AND DISTRICT COURT PROCEEDINGS

Saurabh Vishnubhakat, Arti K. Rai & Jay P. Kesan†

I. INTRODUCTION

This is the first paper in a multipart empirical and theoretical project studying the new post-grant review proceedings set up at the U.S. Patent and Trademark Office (“USPTO”) Patent and Trial Appeal Board (“PTAB”) by the America Invents Act of 2011 (“AIA”).1 These new administrative trial-type proceedings represent a significant change in the relationship between the system of patent litigation in Article III courts and the administrative state. Not surprisingly, such dramatic change itself yields additional litigation possibilities: Cuozzo Speed Technologies v. Lee, a case addressing divergence between the manner in which the PTAB and Article III courts construe patent claims, will soon be argued in the U.S. Supreme Court.

Although PTAB proceedings have proved to be both popular and controversial, scholarly analysis of litigant behavior has thus far been limited to descriptive data summaries or specific policy perspectives on post-grant challenges, such as their impact on the well-rehearsed patent troll debate.2 To our knowledge, this article is the first comprehensive empirical and analytical study of how litigants use these administrative procedures relative to Article III litigation. In addition to assessing the behavior of litigants, we analyze the behavior of both the PTAB and the courts.

Under the AIA, defendants, potential defendants, and third parties now confront the question of whether and when to challenge the validity of patents by filing one or more petitions for inter partes review (“IPR”) or, if applicable, petitions for covered business method (“CBM”) review. IPR petitions are filed against individual patents (and claims thereof), but multiple petitions against a patent may be filed by the same or different parties, and a single petition may be filed or joined by

† Saurabh Vishnubhakat is an Associate Professor of Law at the Texas A&M University School of Law, a Fellow at Duke Law Center for Innovation Policy, and a former Expert Advisor to the Chief Economist of the United States Patent and Trademark Office. Arti K. Rai is the Elvin R. Latty Professor of Law at Duke Law School, Faculty Co-Director of the Duke Law Center for Innovation Policy, and the former Administrator for Policy and External Affairs of the USPTO. Jay P. Kesan is a Professor of Law and the H. Ross & Helen Workman Research Scholar at the University of Illinois College of Law and was an inaugural Thomas Alva Edison Distinguished Scholar at the USPTO. The arguments in this writing are the authors’ and should not be imputed to the USPTO or to any other organization. For thoughtful questions and suggestions, we are grateful to workshop participants and commentators at the University of Pennsylvania Law School, the University of San Diego School of Law 6th Annual Patent Law Conference, the University of Illinois College of Law 4th Annual Empirical Patent Law Conference, and the Duke Law Innovation Policy Roundtable on the PTAB’s Post-Grant Review Proceedings.

multiple parties. Similarly, CBM petitions are filed against individual patents and claims that are directed to eligible business-method-related inventions.3

Meanwhile, patent owners still face the question of which patents to assert, when and where to assert them, and against whom to assert them. The AIA’s anti-joinder provision for Article III litigation arguably increases complexity by substantially reducing owners’ ability to sue multiple defendants in a single case.4 Thus, patent owners wishing to sue multiple defendants on a given patent generally have to sue them individually. More importantly for our purposes, the rise of the PTAB forces patent owners to factor in the strong possibility of retaliatory or even preemptive patent validity challenges at the PTAB. As a result, two complex frameworks of resolving patent disputes now coexist: infringement litigation and declaratory judgment actions in Article III courts, along with administrative invalidation actions in the PTAB.

Multiple proceedings with many potential parties offer a number of strategic possibilities. Two examples of ongoing litigation involving certain highly asserted and highly petitioned patents provide an illustration of the complexities and the correspondingly complicated strategic questions. Although these cases are hardly representative, they do provide clear examples of the multiple, perhaps even combinatorial, strategic possibilities.

In a set of seven cases filed between July 1 and July 9, 2013, Zond, a plasma discharge technology developer, asserted a suite of patents in Massachusetts district court against nine defendants.5 Intel, one of the defendants, responded by filing IPR petitions on all of the asserted patents.6 In April 2014, Intel persuaded the Massachusetts district court to grant a stay of the

---

3 In ongoing work, discussed in summary below, we are looking in detail at patents that are the subject of more than one petition. We are dividing these patents into two categories: those that are challenged by the same petitioner multiple times, and those that are challenged by different petitioners. We are further subdividing the two categories by claims and grounds.

litanet. Within two months of the court granting a stay to Intel, all but one of the defendants had filed IPR petitions on the same claims and the same grounds. All of the petitioning defendants

received stays, and the PTAB joined them to the Intel petitions. Although Intel ultimately settled, PTAB review of the challenged patents continues, albeit with a new lead petitioner.9

In another set of cases, E-Watch sued eleven firms on two digital signal transmission patents in the Eastern District of Texas.10 A third-party firm filed the first PTAB petition related to those patents.11 Subsequently, HTC, a defendant, instituted a petition, and the institution of the HTC petition triggered other petitions.12

A major normative argument for administrative ex post review is that it should be an efficient, accessible, and accurate substitute for Article III litigation over patent validity.13 In this paper, we assess the substitution hypothesis, using individual patents as our general unit of analysis as well as investigating patent-petitioner pairs and similar details in greater depth. Our data indicate that the “standard model” of substitution—wherein a district court defendant subsequently brings an administrative challenge to patent validity—is indeed occurring. The majority (about 70 percent) of petitioners who bring inter partes review challenges fit the standard model. In fact, our data indicate that both explicit substitution and potential settlement of Article III litigation in the shadow of an IPR challenge might be occurring. This substitution effect would suggest that the PTAB should use a claim construction standard that mirrors that of the district court.

9 Joint motions to terminate proceedings, all filed simultaneously on Sept. 12, 2014, settled the Intel-initiated IPR petitions on Zond’s patents. The settlement agreement between Intel and Zond that governs the termination of all these proceedings is confidential.
13 Others (including one of us) have argued that to the extent the procedures set up by the AIA resemble formal adjudications, they could serve as a vehicle not simply for error correction but also for legal and policy development. See, e.g., Arri K. Rai, Patent Validity Across the Executive Branch: Ex Ante Foundations for Policy Development, 61 DUKE L.J. 1237 (2012); Melissa F. Wasserman, The Changing Guard of Patent Law: Chevron Deference for the PTO, 54 WM. & MARY L. REV. 1959 (2013). In this Article, however, we focus on error correction.
Notably, however, standard substitution is not the only use of the PTAB: particularly in the area of IPRs, we also see a surprising percentage of cases (about 30 percent) where the petitioner is not the target of a prior suit on the same patent. The frequency of these nonstandard petitioners, as well as their tendency to join the same petitions as an entity that has been sued, varies by technology. Our data on nonstandard petitioners thus provide some insight into the extent patent challengers are engaging in collective action to challenge patents.

Depending on the details of how nonstandard petitioning and collective action are being deployed, this activity could provide a social benefit or constitute a form of harassment. As we discuss in Part II, many commentators have noted that challenging an invalid patent, particularly in expensive Article III litigation, represents a collective action problem. Administrative alternatives may ease the collective action problem but may also provide opportunities for harassing patent owners. As another indicator of potential harassment and delay, we also look at the frequency of serial petitioning on a given patent.

Of course, substitution of any sort (as contrasted with duplication) can occur only if administrative review is accurate and efficient, and courts generally stay any related Article III litigation pending administrative review. In the case of declaratory judgment (“DJ”) litigation, the AIA both bars a DJ litigant from bringing a subsequent administrative review and provides for automatic stays of any subsequent DJ actions. So the issue of duplication primarily arises in the context of infringement litigation brought by the patent owner. Although a full answer to the duplication issue awaits further decision making in cases currently before the PTAB and the courts, we provide some initial data on the question.

In this article, Part II discusses the normative arguments for and against administrative ex post validity review as a substitute for judicial review. It reviews these arguments as they developed in earlier incarnations of administrative review and as they developed in the far more robust AIA proceedings. Part III provides the large-scale empirical data we have gathered. It discusses various indicia of a general substitution effect, in the context of particular technologies, and in particular district courts. We also discuss the phenomenon of nonstandard petitioners and the collective action in which they sometimes engage. Additionally, Part III presents data regarding multiple IPR petitions filed against the same patent. Based on this data, Part III examines agency and court decision-making in the face of strategic behavior by the parties before them. Part IV discusses our major findings, suggests directions for further research, and outlines our ongoing agenda to advance these research goals.

15 Perhaps not surprisingly, since patents became available for PTAB review, DJ actions have fallen both in absolute terms and as a percentage of case filings.
II. EX POST REVIEW OF PATENT VALIDITY

This part discusses the normative arguments that have motivated administrative review of patent validity, particularly as a substitute for litigation in the federal courts. Against the backdrop of this normative framing, we then evaluate ex parte and inter partes reexamination (the latter now defunct) as well as the new ex post review procedures introduced by the AIA.

A. MOTIVATIONS FOR (AND CONCERNS REGARDING) ADMINISTRATIVE REVIEW

The initial patent examination process will inevitably produce some improper patent grants. To the extent improperly granted patents impose unnecessary costs and call into question the credibility of the patent system, these improper grants ought to be corrected. The importance of error correction remains a dominant theme in ex post patent review, especially in evaluating the success of the AIA. Perhaps even more important, however, is the recurring theme of institutional design: the USPTO’s examination errors should not merely be corrected, but should be corrected outside the federal courts.

Several interrelated arguments counsel in favor of administrative review. Most obviously, Article III litigation is quite costly. The biennial economic survey of the American Intellectual Property Law Association indicates that even for the lowest-stakes category of patent lawsuits (in which less than $1 million was at risk), median litigation costs have risen from $650,000 in 2005 to $700,000 in 2013. And for the highest-stakes lawsuits (in which more than $25 million was at risk), median litigation costs rose over the same time period from $4.5 million to $5.5 million.

The high cost of litigation would be less problematic if these great expenditures yielded great accuracy in judicial outcomes. As standard economic accounts of procedure note, the goal of procedure is the minimization of litigation costs and error costs. But decisions reached in Article

17 For purposes of this article, we need not engage the robust academic debate over the level of error the initial examination process should tolerate.
18 Ex post review as a means for correcting USPTO examination errors has been a consistent theme in institutional discussions of patent quality. See, e.g., In re Swanson, 540 F.3d 1368, 1375 (Fed. Cir. 2008) (“Congress intended reexaminations to provide an important ‘quality check’ on patents that would allow the government to remove defective and erroneously granted patents.”); In re Recreational Techs. Corp., 83 F.3d 1394, 1396–97 (Fed. Cir. 1996) (“The reexamination statute’s purpose is to correct errors made by the government . . . and if need be to remove patents that never should have been granted.”); Patlex Corp. v. Mossinghoff, 758 F.2d 594, 603 (Fed. Cir. 1985) (“The legislative history of the reexamination statute makes clear that its purpose is to cure defects in administrative agency action with regard to particular patents and to remedy perceived shortcomings in the system by which patents are issued.”).
19 The degree to which the AIA ex post administrative review procedures are actually capturing and correcting ex ante examination errors is the focus of related large-scale empirical research relying on much of the same data as the present project. Saurabh Vishnubhakat, David L. Schwartz & Alan C. Marco, What Ex Post Review Has Revealed About Patents (in progress).
III litigation may not be particularly accurate. Because patent law often uses science-based proxies such as “ordinary skill in the art” to tackle relevant legal and policy goals, the subject matter of patent law can be highly complex as a scientific matter. And even if a case is not highly complex as a scientific matter, the manner in which factual findings interact with law and policy can be complex. With the possible exception of Federal Circuit judges, judges in the federal courts tend to be generalists who may not be equipped to tackle complex questions at the intersection of law, science, and policy. Moreover, district courts have to contend with juries, who may be even less equipped than federal judges to address complex questions of law and science. In contrast, administrative patent judges have long been required to be “persons of competent legal knowledge and scientific ability.”

Empirical research bears out concerns about the capacity of judges to resolve patent disputes. The generalist background of most district judges has led many plaintiffs to seek out specific districts, with the natural result being a certain amount of de facto specialization. A few districts see a disproportionate number of patent cases, and some have reputations as “rocket dockets” for

23 For example, a patent may be challenged as being invalid because the invention that it claims was obvious under 35 U.S.C. § 103 in light of the prior technical knowledge available to those in the field at the time of invention. Whether a claimed invention is obvious is a question of law reviewed de novo on appeal. But the legal determination is based on predicate findings of fact regarding the prior art and the level of skill in the art. These findings are supposed to be reviewed deferentially on appeal. See, e.g., In re Kubin, 561 F.3d 1351, 1355 (Fed. Cir. 2009) (concerning review from PTO patent denial); see also Graham v. John Deere, 383 U.S. 1, 17 (1966) (explaining factual findings made by district court subject to clearly erroneous review). Meanwhile, the USPTO’s factual findings in granting a patent are presumed correct and must be rebutted by clear and convincing evidence in the courts. Microsoft Corp. v. i4i Ltd. P’ship, 131 S. Ct. 2238 (2011). See generally Arri K. Rai, Engaging Facts and Policy: A Multi-Institutional Approach to Patent System Reform, 103 Colum. L. Rev. 1035, 1068–75 (2003) (discussing the technical complexity often involved in applying patent law’s fact-based standards).

24 For example, the practical probative value of factual findings toward obviousness analysis may vary by the inherent unpredictability of the given technology: whereas mechanical inventions operate in relatively predictable and well-understood ways, small technical changes may lead to dramatic and unexpected results in biochemistry. Pfizer, Inc. v. Apotex, Inc., 480 F.3d 1348, 1364 (Fed. Cir. 2007).

26 See Mark Lemley, Why Do Juries Decide If Patent Are Valid?, 99 Va. L. Rev. 1673, 1705 (2013) (noting that as far back as the 1950s, modern technology was already “judged too complex for a jury to understand, so it made no sense to give them the patent questions” where avoidable).

27 35 U.S.C. § 6 (requiring that administrative patent judges shall be persons of competent legal knowledge and scientific ability).

29 Jay P. Kesan & Gwendolyn G. Ball, Judicial Experience and the Efficiency and Accuracy of Patent Adjudication: An Empirical Analysis of the Case for a Specialized Patent Trial Court, 24 Harv. J.L. & Tech. 393, 447 (2011) (showing in Table III that the distribution of how many cases judges hear is highly skewed such that most judges hear fewer than ten patent cases each whereas roughly the top fifth of high-volume judges hear over three-fifths of all patent cases).
resolving them quickly. Empirical evidence suggests that, among the subset of judges who preside over patent cases regularly, increased experience may produce more efficient and accurate case outcomes. Yet this private ordering toward certain districts only underscores the overall lack of expertise among district court judges. Moreover, some commentators have argued that aggressive attempts to specialize in patent disputes by judges whose districts are found outside traditional technology centers lead to overly plaintiff-friendly procedures rather than accurate adjudication.

Another reason to favor low-cost administrative review, rather than high-cost Article III review, is that patent plaintiffs and defendants have asymmetric incentives. Supreme Court case law builds into the patent doctrine asymmetric incentives to litigate. Under the law’s estoppel provisions, a challenger who successfully invalidates a patent provides a public good—the challenger benefits not only itself but also all other potential challengers. By contrast, the challenger who loses is uniquely estopped from challenging the patent again.

Although the public-good-type incentive may exist in the administrative context as well (and, indeed, exists in both pre-AIA and post-AIA inter partes proceedings as a consequence of the congressional decision to implement relatively strong statutory estoppel provisions), the significantly lower cost of the administrative proceeding presumably reduces its scale. In other words, although a challenger may still be reluctant to provide a public good, a public good that costs a few hundred thousand dollars is quite different from one that costs several million dollars. Moreover, the absence

31 Kesan & Ball, supra note 29, at 423–43.
34 See Blonder-Tongue Labs., Inc. v. Univ. of Ill. Found., 402 U.S. 313, 350 (1971) (stating a patent invalidity finding creates nonmutual defensive collateral estoppel, so that a patent that is invalid as against one party is invalid as against the world); see also Joseph Farrell & Robert P. Merges, Incentives to Challenge and Defend Patents: Why Litigation Won’t Reliably Fix Patent Office Errors and Why Administrative Patent Review Might Help, 19 BERKELEY TECH. L.J. 943 (2004) (noting that, in addition to public good problem, disincentives to challenge may be created in certain situations involving oligopolistic competition between licensee that pay sales-based royalties to the patentee).
35 Interestingly, some practitioners have suggested that the pre-AIA tendency of so-called patent trolls to sue multiple defendants in one suit might have facilitated some collective action through informal or formal joint defense agreements. See Daniel Bream and Lee Cheng, Benefits of A Coordinated Joint Defense in Patent Cases, Law 360, November 27, 2012. Whether or not that was the case, the AIA’s anti-joinder provision may limit this potential nudge towards collective action. Id.
of a standing requirement in IPR proceedings creates possibilities for additional entities, including entities that represent groups of potential defendants in a given industry, to challenge patents.

For these reasons, a less costly, more expert, and more widely accessible institution has long been thought desirable. On the other hand, even advocates of an administrative mechanism have noted the potential for harassment of patent owners that might arise in such administrative review. Harassment potential exists as the obvious flip side of access created by low cost and absence of an Article III standing requirement. Moreover, to the extent that courts do not believe that administrative review will in fact be accurate and efficient, and thus don’t stay any related Article III litigation, such review may create costly duplication rather than efficiency.

B. OPPOSITION MECHANISMS PRIOR TO THE AIA

In 1980 Congress created a mechanism for USPTO ex parte reexamination of patent validity and in 1999 Congress created a mechanism for inter partes reexamination. These procedures have realized their error-correction and efficiency goals to varying degrees and have interacted in important ways with federal court litigation.

1. Ex Parte Reexamination

As the Federal Circuit recognized in a contemporaneous opinion, the ex parte reexamination system was an effort to reap three principal benefits. First, the new procedure could settle validity disputes more quickly and less expensively than the often protracted litigation involved in such cases. Second, the procedure would allow courts to refer patent validity questions to the expertise of the Patent Office. Third, reexamination would reinforce investor confidence in the certainty of patent rights by affording the USPTO a broader opportunity to review doubtful patents.

The parameters of this reexamination procedure reflect its twin goals: to correct those USPTO examination errors that improperly allowed patents to issue, and to do so more cheaply, accurately, and accessibly than the federal courts could.

Cost wise, the USPTO’s ex parte reexamination fee has grown from $1,500 in the early 1980s to $12,000 at present, and attorney costs have risen to approximately $20,000 at the mean and

---

37 E.g., Kesan, supra note 14 (noting the potential for delay and harassment in patent office proceedings); Jonathan Masur, Patent Inflation, 121 YALE L.J. 470, 522 (2011) (recognizing that “inter partes review could potentially be abused by parties interested only in delaying and harassing competitors”); Joe Matal, A Guide to the Legislative History of the America Invents Act: Part II of II, 21 FED. CIR. B.J. 539, 550 (2012) (noting that the AIA’s own statutory text directs the USPTO to penalize abuses of administrative validity challenge proceedings “such as to harass or to cause unnecessary delay or an unnecessary increase in the cost of the proceeding”).

38 That said, the challenger who loses at the administrative level may have to meet Article III standing requirements in order to appeal. See Consumer Watchdog v. Wis. Alumni Research Found., 753 F.3d 1258 (Fed. Cir. 2014).

41 See Patlex Corp. v. Mossinghoff, 758 F.2d 594, 602 (Fed. Cir. 1985) (internal quotations and citations omitted) (emphasis added).

43 37 C.F.R. § 1.20(c)(1).
$15,000 at the median.44 Even today, the expense of ex parte reexamination tends to be below $35,000—some twentyfold less costly than the lowest-stakes category of litigation.45 Moreover, when the USPTO decides to deny a request for ex parte reexamination, the agency refunds most of the fee to the requester, further lowering the financial hurdle, and risk, to a patent validity challenge.46 Consistent with its mandate to correct examination errors, ex parte reexamination requires a “substantial new question of patentability” as to one or more of the challenged patent claims, and this standard may be met by reargument of information that was previously before the patent examiner.47 Access to reexamination is also unconstrained by traditional Article III standing requirements. Anyone at any time may seek reexamination of a patent, including the patent owner and the USPTO itself,48 and courts narrowly construe agreements not to challenge patent validity, in favor of access to reexamination.49

However, for all its intended benefits, the reexamination procedure introduced in 1980 has long been criticized for its ex parte nature, which excludes any third-party participation beyond filing the initial request.50 According to the PTO’s statistics,51 29 percent of the ex parte reexaminations filed between July 1981 and September 2014 were filed by the patent owner itself, presumably as a potential mechanism for strengthening the patent.52

2. Inter Partes Reexamination

To improve public participation in the administrative review of patent validity, in 1999 Congress created a new procedure for inter partes reexamination.53 Designed to coexist with the old ex parte procedure, inter partes reexamination conferred significant rights upon third-party requestors to participate in the USPTO’s review of patent validity. A requestor could comment on every substantive response by the patent owner to an examiner action and could appeal the examiner’s decision to the USPTO’s administrative review board.

44 See AIPLA SURVEY I-112 (2013) (tabulating attorney costs reported for ex parte reexamination); AIPLA SURVEY I-136 (2011); AIPLA SURVEY I-114 (2009); AIPLA SURVEY I-76 (2007).
45 Janis, supra note 16.
46 See 35 U.S.C. § 303(e); 37 C.F.R. § 1.26(e).
52 Certain Federal Circuit cases have indicated that patents that survive reexamination should be viewed even more deferentially by the courts than ordinary patents. E.g., Gould v. Control Laser Corp., 705 F.2d 1340, 1342 (Fed. Cir. 1983) (explaining that reexamination ought to “facilitate trial of [the reexamined] issue by providing the district court with the expert view of the PTO (when a claim survives the reexamination proceeding)” (emphasis added).
However, inter partes reexamination also posed significant barriers. One was a strong estoppel provision, barring the challenger from raising in Article III litigation any issues it raised or could have raised during the inter partes reexamination. Even more significant was the prolonged duration of reexamination. The reexaminations themselves took an average of 39.5 months, and then had to be appealed to the Board of Patent Appeals and Interferences. From its creation in 1999 through 2012, when it was subsumed under the new administrative review system established by the AIA, inter partes reexamination was never widely used as a means for challenging the validity of patents.

C. ADMINISTRATIVE OPPOSITION UNDER THE AIA

The America Invents Act of 2011, which created four new procedures for reevaluating the validity of patents, significantly strengthened the U.S. system for administrative review of patent validity. One procedure, post-grant review, is just beginning its operation as it only applies to patents that issue from applications filed under the AIA’s new first-inventor-to-file regime. Another procedure, supplemental examination, allows patent owners themselves to provide new information that help fortify the validity of their patents. Thus far, the opportunity for robust public participation in challenging pre-existing patents has arisen in the two remaining procedures: inter partes review (IPR) and the transitional program for covered business method (CBM) review.

Before turning to the specifics of these proceedings, we note the AIA’s desire to promote administrative review is probably clearest in the situation where the petitioner is a prior district court defendant. In the case of inter partes review, this “standard model” is endorsed, at least implicitly, by several features we discuss in detail below. One feature is the requirement that IPR review occur within one year of a prior district court lawsuit. The congressional decision to include a strong estoppel provision, and thus potentially set up in the administrative context the Article III collective action problem for challengers, may also reflect congressional embrace of the standard model.

In the case of CBM review, Congress embraced the standard model even more fully. CBM review explicitly requires the petitioner to be “charged with infringement,” language the PTO has

55 This average included some outlier cases, but the median was a lengthy 34.1 months. See Inter Partes Reexamination Filing Data, USPTO, http://www.uspto.gov/learning-and-resources/statistics/reexamination-information [http://perma.cc/82NT-8L67] (last updated July 8, 2015).
56 From November 29, 1999, through the abolition of inter partes reexamination effective September 16, 2012, fewer than 2,000 requests were filed, and in most years the usage of inter partes reexamination represented only a fraction of ex parte reexamination. See Reexamination Statistics, USPTO, http://www.uspto.gov/learning-and-resources/statistics/reexamination-information [http://perma.cc/82NT-8L67] (last updated July 8, 2015).
58 As of October 31, 2015, only thirteen post-grant review petitions have been filed in the USPTO. See USPTO, PATENT REVIEW PROCESSING SYSTEM, http://www.uspto.gov/sites/default/files/documents/2015-10-31%20PTAB.pdf
60 See supra TAN 37-41
interpreted as requiring the petitioner to prove standing necessary to bring a declaratory judgment action in district court.\(^{61}\)

That said, in the case of IPRs, the statutory language certainly does not preclude petitioners that are outside the standard model. IPR proceedings have no standing requirement, and the AIA also provides for potential collective action by allowing joinder to existing petitions.

Thus far, the new AIA proceedings do appear to be substantially cheaper than district court litigation. According to the 2015 AIPLA Economic Survey, the median cost of an IPR through a PTAB hearing was $275,000 and through appeal was $350,000.\(^ {62}\) Although the AIPLA survey does not differentiate between IPRs based on amount of money at risk, these figures are substantially lower than the median cost of district court litigation even for the lowest stakes cases.\(^ {53}\)

1. **Inter Partes Review**

IPR challenges are available to anyone, other than the patent owner,\(^ {64}\) who has not previously sought to invalidate the patent through a civil action\(^ {65}\) and who has not been sued more than one year earlier for infringing the patent in question.\(^ {66}\) An IPR petition may not be filed anonymously: the petitioner must disclose all its real parties in interest.\(^ {67}\) For any patent that issued under the old first-to-invent regime, an IPR petitioner may file a challenge immediately.\(^ {68}\)

For a patent that issues under the new first-inventor-to-file regime, an IPR petitioner may file a challenge only after nine months from the patent’s date of grant or after the termination of any post-grant review that has been instituted as to the patent, whichever is later.\(^ {69}\) An IPR may challenge patent claims only on the grounds that they fail to satisfy the novelty requirement\(^ {70}\) or the nonobviousness requirement,\(^ {71}\) and may only argue on the basis of prior patents or printed publications.\(^ {72}\) To decide that an IPR petition warrants institution of an IPR proceeding, the USPTO must find a “reasonable likelihood that the petitioner would prevail with respect to at least [one] of the claims challenged in the petition.”\(^ {73}\)

---

61 37 CFR Section 42.302 (“[c]harged with infringement means a real and substantial controversy regarding infringement of a covered business method patent exists such that the petitioner would have standing to bring a declaratory judgment action in Federal court”).
63 See supra __.
65 See 35 U.S.C. §§ 315(a)(1), (3) (providing that a counterclaim challenging the validity of a patent claim in an infringement action is not a civil action.).
67 This disclosure is necessary because the constraints on who can petition also apply to all legal privies and real parties in interest of the would-be petitioner. See 35 U.S.C. §§ 315(a)(1), (b).
69 Id.
2. **Covered Business Method Review**

CBM challenges are available only to parties who have previously been sued for infringing, or charged with infringing, the patent in question.\(^{74}\) Like IPR petitions, CBM review petitions may not be filed anonymously—they must disclose real parties in interest.\(^{75}\) Through rulemaking, the PTO has interpreted the statutory “charged with infringement” language to mean “a real and substantial controversy regarding infringement . . . exists such that the petitioner would have standing to bring a declaratory judgment action in Federal Court.”\(^{76}\) Congressional creation of a standing requirement in a CBM review proceeding contrasts with the absence of such a requirement in an IPR proceeding. In general, to the extent that IPR and CBM review provisions differ (and we detail other differences below), these differences may arise because CBM review was inserted into the AIA relatively late in the day, and the members of Congress most responsible for the review saw CBM patents as categorically suspect.\(^{77}\)

For any eligible business method patent\(^{78}\) that issued under the old first-to-invent regime, a CBM petitioner may file a challenge at any time after the procedure was established on September 16, 2012.\(^{79}\) For an eligible business method patent that issues under the new first-inventor-to-file regime, a CBM petitioner may file a challenge only after nine months from the patent’s date of grant or after the termination of any post-grant review that has been instituted as to the patent, whichever is later.\(^{80}\) A CBM petition may challenge patent claims on essentially the complete range of

\(^{75}\) See id.

\(^{76}\) 37 C.F.R. § 42.302(a).

\(^{77}\) Senators Schumer and Kyl, who proposed a version of the CBM provision as part of a floor managers’ amendment on March 1, 2011, were highly suspicious of all business method patents. In his March 2011 Senate floor testimony, Senator Schumer described business method patents as “the bane of the patent world” and castigated the decision the Federal Circuit in State Street Bank to allow such patents. 157 Cong Rec. at S1363 (March 8, 2011) (statement of Senator Schumer). Among many Senators on the Republican side, positions were equally strong. The Senate Republican Policy Committee’s summary of § 18, introduced into the Congressional Record by Senator Kyl, stated (somewhat inaccurately): Recent court decisions, culminating in last year Supreme Court decision in Bilski v. Kappos, have sharply pulled back on the patenting of business methods, emphasizing that these “inventions” are too abstract to be patentable. In the intervening years, however, PTO was obliged to issue a large number of business-method patents, many or possibly all of which are no longer valid. The Schumer proceeding offers a relatively cheap alternative to civil litigation for challenging these patents, and will reduce the burden on the courts of dealing with the backwash of invalid business-method patents. 157 Cong. Rec. S1367 (Mar. 8, 2011) (statement of Sen. Kyl).

\(^{78}\) The AIA defines an eligible “business method” patent as: “a patent that claims a method or corresponding apparatus for performing data processing or other operations used in the practice, administration, or management of a financial product or service, except that the term does not include patents for technological inventions.” Leahy-Smith America Invents Act, Pub. L. No. 112-29, § 18(d)(1), 125 Stat. 331. USPTO regulations further define a “technological invention” based on “whether the claimed subject matter as a whole recites a technological feature that is novel and unobvious over the prior art; and solves a technical problem using a technical solution.” 37 C.F.R. § 42.301(b).

\(^{79}\) CBM challenges became available one year from the enactment of the AIA, which was signed into law on September 16, 2011. Leahy-Smith America Invents Act, Pub. L. No. 112-29, § 18(a)(1), 125 Stat. 329.

Strategic Decision Making in Dual PTAB and District Court Proceedings

patentability criteria, including subject-matter eligibility, novelty, nonobviousness, utility, single invention, enablement, written description, definiteness, and others. To decide a CBM petition warrants institution of a CBM review, the USPTO must find that “it is more likely than not that at least [one] of the claims challenged in the petition is unpatentable,” or that “the petition raises a novel or unsettled legal question that is important to other patents or patent applications.”

3. Intersection with the Courts

Both IPR and CBM review proceedings generate estoppel effects, though not in the same way. The estoppel generated by IPR is quite strong. An IPR resulting in a final written decision precludes the petitioner from asserting any claim in either the USPTO, the federal courts, or the International Trade Commission (“ITC”) that the petitioner raised, or could have raised, in the IPR proceeding. By contrast, a CBM review that results in a final written decision creates full estoppel within the USPTO only—it precludes the petitioner from asserting any claim in the USPTO that the petitioner raised, or could have raised, in the CBM review proceeding. With respect to the courts, CBM petitioners are not estopped from invoking those invalidity grounds that they raised at the USPTO. Both IPR and CBM review proceedings trigger automatic stays of copending declaratory judgment litigation. Just as a would-be petitioner cannot challenge a patent in an IPR if it has previously challenged that patent in a civil action, if a petitioner files such a civil action after the IPR petition, then that civil action is automatically stayed. The stay may be lifted only if the patent owner requests it, if the patent owner claims or counterclaims infringement against the petitioner, or if the petitioner dismisses its civil action. Likewise, if a petitioner files a civil action challenging the

85 See 35 U.S.C. § 101 (allowing an inventor or discoverer to “obtain a patent”) (emphasis added).
92 The same estoppel effects bind the petitioner’s privies and real parties in interest.
93 35 U.S.C. § 315(e).
94 The same estoppel effects bind the petitioner’s privies and real parties in interest.
95 35 U.S.C. § 325(e)(1). In general, the provisions of post-grant review, which apply to patents filed under the first-inventor-to-file system, also apply to CBM review, unless Section 18 of the AIA otherwise specifies.
96 35 U.S.C. § 325(e)(2) generally estops the relitigation in court of arguments that were raised or could have been raised in the USPTO, but AIA § 18 provides that § 325(e)(2) does not apply to CBM proceedings—meaning that patent validity challengers are free to raise those arguments again in the courts.
97 See supra note 65 and accompanying text.
99 Id.
patent after filing a CBM petition on the same patent, then that civil action must automatically be stayed.\footnote{35 U.S.C. § 325(a)(2).} As with IPR, an automatic CBM stay may be lifted only if the patent owner requests it, if the patent owner claims or counterclaims infringement against the petitioner, or if the petitioner dismisses its civil action.\footnote{Id.}

Meanwhile, courts still have the discretion to stay existing infringement litigation brought by a patent owner pending the outcome of an IPR or CBM review proceeding. For IPRs, where the AIA does not specify the standard for such stays, prior standards pertaining to ex parte and inter partes reexamination remain valuable, though not conclusive, precedent.\footnote{See Matthew R. Frontz, \textit{Staying Litigation Pending Inter Parties Review and Effects on Patent Litigation}, 24 \textit{Fed. Cir. B.J.} 469, 469 (2015) (“The courts have precedent in reviewing motions to stay litigation pending the reexamination procedure; however, the newly enacted statutory limitations have made this issue ripe for judicial review.”).}

Drawing on the reexamination case law, courts continue to consider the familiar three factors in deciding whether to issue stays: the potential for prejudice or tactical disadvantage; the timing of the desired stay relative to that of the administrative proceeding itself; and the likelihood that resolution of the administrative proceeding may simplify the pending litigation.\footnote{Id. at 473 (citing Universal Elecs., Inc. v. Universal Remote Control, Inc., 943 F. Supp. 2d 1028, 1030–33 (C.D. Cal. 2013)); see also 35 U.S.C. § 311(b) and accompanying text.}

Notably, the AIA specifies a four-factor test for CBM-related stays. This four-factor test encompasses three factors courts previously used in determining contested motions for stay under the old reexamination system and adds a fourth factor—“whether a stay, or the denial thereof, would reduce the burden of litigation on the parties and on the court.”\footnote{Leahy-Smith America Invents Act, Pub. L. No. 112-29, § 18(b)(1), 125 Stat. 284.} Moreover, for purposes of “ensur[ing] consistent application of established precedent,” the AIA provides for immediate interlocutory appeal of the district court’s decision regarding stays.\footnote{Leahy-Smith America Invents Act, Pub. L. No. 112-29, § 18(b)(2), 125 Stat. 331.} It also states the Federal Circuit’s standard of review on appeal from a district court decision “may be de novo.”\footnote{Id.} Using this standard, the Federal Circuit has held that district courts have limited discretion to deny CBM-related stays when all claims asserted in litigation are also under CBM review.\footnote{VirtualAgility Inc. v. Salesforce.com, Inc., 759 F.3d 1307, 1309-10, 1320 (Fed. Cir. 2014).}

In general, the AIA’s legislative history indicates Congress wanted both IPRs and CBM reviews to serve as a substitute for Article III litigation over patent validity. However, for those defendants who are charged with infringement of a patent that falls within the “covered business method” designation, the broader number of grounds available for challenge, less onerous estoppel provisions, and a codified stay provision likely make CBM review even more attractive than IPR.

III. \textbf{AGENCY OR COURT: STRATEGIC CHOICES}

To describe more fully how these doctrinal frameworks operate in practice, we offer here the largest-scale empirical study to date of ex post administrative scrutiny of patent validity. Our analysis is based on a new dataset of all IPR and CBM petitions filed in the USPTO since the creation of
these procedures under the AIA, as well as data on Article III patent cases filed contemporaneously with IPR and CBM petitions, and on requests for litigation stays pending the outcome of administrative challenges to patent validity. Our findings provide a comprehensive view of ex post administrative review that assimilates the more localized findings of prior empirical studies. Our unit of analysis is generally the individual patent, and we additionally explore patent-petitioner pairs and other details as well. Unless otherwise specified, our time period of observation is from September 16, 2012, through June 30, 2015.

Our analysis can be replicated using data from the DocketNavigator service, which provides free and low-cost access to coded metadata about patent cases in the U.S. federal courts as well as the PTAB. Like LexMachina and other widely used patent litigation data services, DocketNavigator obtains its underlying litigation data from the federal judiciary’s Public Access to Court Electronic Records (PACER) service, which is the principal data source of many innovation studies. Neither PACER nor the commercial services that rely on it permit researchers to disclose significant portions of their database. Accordingly, we describe the DocketNavigator data we used with the understanding that other researchers can readily access it to replicate our study.

A. Litigant Behavior

Like the administrative ex post validity challenge mechanisms that preceded the AIA, the IPR and CBM review procedures were established to provide more affordable, more expert, and more accessible adjudication than litigation. However, what would-be patent challengers regard as barriers to contesting validity, are safeguards from the perspective of patent owners. We are quite interested, therefore, in discovering whether and under what circumstances IPR and CBM reviews are serving as defensive tools for defendants previously charged in district court with infringement; as tools for preemptive attacks upon patent owners; as mechanisms for harassment and abuse; or as a mix of these functions.

108 E.g., Love & Ambwani, supra note 2.
113 See infra Appendix A.
114 Such barriers include, for example, potential estoppel in the federal courts from initiating an administrative validity challenge in the USPTO. Supra Part II.C.3. More generally, as discussed in detail in Part II, patent challengers face a significant collective action problem. See Thomas, supra note 36, at 333 (noting that third parties to a successful validity challenge “may readily free ride from the efforts of the former patentee and the opponent, employing the teachings of the invalidated patent to practice the invention without compensation to anyone”).
In general, we show that most patents challenged in the PTAB are also challenged in Article III litigation. However, there is no clear relationship between the number of times a patent is challenged in the PTAB and the numbers of times it is asserted in district court. Additionally, while Chemical patents are disproportionately likely to be the subject of a PTAB-only challenge, Computers and Communications (CCM) patents are disproportionately unlikely to be challenged only in the PTAB.

We also studied behavior at the level of the individual petitioner. For both CBM reviews and IPRs, the standard substitution model describes the majority of cases. Notably, however, in the context of IPRs, the percentage of petitioners who fall outside the standard model because they have not themselves previously been sued on the patent in question is surprisingly substantial, on the order of 30 percent. This percentage is particularly high with respect to Drugs and Medical patents. Also notable is the extent to which petitioners that have not previously been sued join the same petitions as those that have been sued. In the case of Drugs and Medical patents, for example, petitioners that have not previously been defendants disproportionately appear to be engaged in collective action with those that are defendants.

1. IPR and CBM Petitions: Descriptive Statistics
   a. IPR Petitions

Through the end of June 2015, petitioners have filed 3,157 petitions for inter partes review. As Figure 1 shows, these filings began slowly in September 2012, when the IPR procedure became available and have risen from twenty petitions per month to roughly 140 petitions per month.

These petitions have been distributed unevenly across technology areas. The National Bureau of Economic Research (“NBER”) categorizes patents into six different technology areas: (1) Chemical (excluding Drugs); (2) Computers and Communications; (3) Drugs and Medical; (4) Electrical and Electronics; (5) Mechanical; and (6) Others. As Figure 2 shows, IPR petitions disaggregated by NBER's six-part category scheme have predominantly challenged CCM-related patents, which account for just over half (50.4%) of all IPR petitions. Figure 3 confirms this trend has persisted from the start, with cumulative filings in CCM-related IPR petitions rising considerably faster than those in all other technology areas.

Although IPR petitions may challenge patent claims as to either novelty or nonobviousness, nonobviousness challenges predominate across all major technology areas. As Figure 4 shows, nearly all IPR petitions include a nonobviousness challenge, whereas the proportion of IPR petitions that include a novelty challenge varies considerably by technology. The preference for including nonobviousness as a basis for challenge is not surprising. While a novelty-based challenge must rest on a single reference, a nonobviousness-based challenge can presumably take advantage of the ability of PTAB judges to engage in complex reasoning that combines multiple references.

b. CBM Petitions

Compared to IPR petitions, usage of the CBM procedure has been considerably smaller in scale. Through the end of May 2015, petitioners have filed 362 petitions for CBM review. As Figure 5 shows, these filings have averaged between ten and fifteen petitions per month. Moreover, because CBM proceedings are oriented by definition toward business-method-related technologies such as information and communications, it is not surprising that an overwhelming majority (82.2%) of CBM petitions challenge Computers and Communications-related patents. Mechanical-related patents make up another 15.9% of CBM petitions, and only a negligible share of CBM petitions fall in any other category. Figure 6 illustrates these trends.

Unlike IPR petitions, CBM petitions may challenge patent claims on a fuller range of patentability requirements: in addition to novelty and nonobviousness, subject-matter eligibility, enablement, written description, and indefiniteness are available grounds. Across this range of options, however, petitioners have focused their attention primarily on subject-matter eligibility and nonobviousness. As Figure 7 shows, 68.6% of CBM petitions challenged the subject-matter eligibility of the patent in dispute, and 71.1% challenged the nonobviousness of the patent. Just under half (48.3%) challenged novelty. By contrast, challenges as to enablement, written description, and indefiniteness each arose in fewer than 20% of petitions.

As with IPR petitions, the relative preference for nonobviousness challenges over novelty challenges in CBM petitions is rational given the greater availability of combining prior art references in evaluating nonobviousness. In addition, the strong preference for subject-matter eligibility challenges is consistent with the widespread view among critics of business method patents that such patents are not just narrowly problematic for inadequate disclosure in the patent specification or lack clarity in the claims—problems that are more the purview of enablement, written description, and indefiniteness—but instead are outside the scope of what should be eligible for patent protection in the first place. 117

Beyond these basic PTAB filing trends, we find that a number of patents have been targets of serial challenges spread across both multiple petitions and multiple challengers in IPR petitions.

---

117 This view was held by Senators Schumer and Kyl, who proposed a version of the CBM provision as part of a floor managers’ amendment on March 1, 2011. In his March 2011 Senate floor testimony, Senator Schumer described business method patents as “the bane of the patent world” and castigated the decision the Federal Circuit in State Street Bank to allow such patents. 157 Cong Rec. at S1363 (March 8, 2011) (statement of Senator Schumer). Among many Senators on the Republican side, positions were equally strong. The Senate Republican Policy Committee’s summary of § 18, introduced into the Congressional Record by Senator Kyl, stated (somewhat inaccurately):

Recent court decisions, culminating in last year Supreme Court decision in Bilski v. Kappos, have sharply pulled back on the patenting of business methods, emphasizing that these “inventions” are too abstract to be patentable. In the intervening years, however, PTO was obliged to issue a large number of business-method patents, many or possibly all of which are no longer valid. The Schumer proceeding offers a relatively cheap alternative to civil litigation for challenging these patents, and will reduce the burden on the courts of dealing with the backwash of invalid business-method patents.

Patents in the Chemical, CCM and Electrical areas are particularly prone to multiple petitions. As Figure 8 shows, a majority of patents in each of these fields were the subject of multiple IPR petitions: 60.6% of Chemical patents, 50.9% of CCM patents, and 58.4% of Electrical patents. Figure 9 shows how these serial challenges are distributed within technology categories, most notably that the highest volume of serial challenges is in the CCM area. We are currently studying the precise nature of these serial challenges (for example, whether they are being brought by the same petitioner) to determine whether they could represent harassment and therefore are problematic from a policy perspective. The frequency of serial challenge to a patent may also be related to the number of defendants against whom the patent is asserted in court.

We turn next to the general question of the relationship between patent challenges at the PTAB and patent litigation in the district courts.

2. Article III Litigation

Contemporaneous with petitions for IPR and CBM review in the USPTO, patent litigation in the federal courts has continued apace. To investigate the interaction between these two fora, we collected data on all 24,162 patent cases filed between September 16, 2011, and June 30, 2015, in the federal district courts.\textsuperscript{118}

Many of these cases involved multiple patents-in-suit, and we observed a total of 49,147 patent assertions across these cases,\textsuperscript{119} or an average of 3.54 assertions per patent case. Figure 10 shows the trend in patent cases over this period, rising from 150 case filings per month in September 2011 to an average of over 500 case filings per month by June 2015. These petitions have also been distributed unevenly across technology areas. Figure 11 shows that patent cases have predominantly involved CCM-related patents, which far outpace all other technology areas, and that this trend has persisted from the start, with cumulative filings in CCM-related patent cases rising considerably faster than in all other technology areas.\textsuperscript{120}

During this time, a total of 14,218 patents were either challenged in an IPR or CBM petition, asserted in litigation, or both. A subset of 11,787 patents were involved in litigation alone; 324 patents were involved in a USPTO proceeding alone; and 2,107 patents were involved in both. Accordingly, about 15.2% of litigated patents are also being challenged in the PTAB,\textsuperscript{121} and about 86.7% of IPR- or CBM-challenged patents are also being litigated in the federal courts.\textsuperscript{122}

\textsuperscript{118} We chose September 16, 2011, as our starting date for district court litigation because it represents the first date on which patents asserted in litigation could become the subject of a PTAB filing. Consistent with our interest in examining the interaction between assertion by patent owners and PTAB petitions, we excluded declaratory judgment actions. In any event, as discussed in the text, see supra note 15 and accompanying text, the AIA essentially makes declaratory judgment actions unavailable to those who file PTAB petitions.

\textsuperscript{119} Though the data that we collected includes cases where design and plant patents were asserted (either exclusively or together with utility patents), we focus our analysis on utility patents.

\textsuperscript{120} Because district court cases can (and frequently do) involve multiple-patents in a single suit—unlike IPR or CBM petitions, which are necessarily limited to a single patent—we calculate technology trends by aggregating a technology’s relative share among the patents that were asserted in each case. For example, a patent case involving three CCM patents and two Electrical patents would have been counted as 0.6 of a CCM case and 0.4 of an Electrical case.

\textsuperscript{121} This is calculated as $2107 / (2107 + 11787) = 15.2\%$.

\textsuperscript{122} This is calculated as $2107 / (2107 + 324) = 86.7\%$. 
These measures suggest validity challenges in the USPTO are, indeed, connected with the threat or fact of infringement litigation, for a large majority of challenged patents are also asserted in court. Indeed, our measures may understate the connection the connection between litigation and assertion at the PTAB. According to Docket Navigator analytics, of the patent cases filed in the U.S. district courts during the time period that we studied, 70.2% were likely settled. Moreover, three-quarters of those likely settlements occurred within 9.9 months. This pattern of likely settlement may have been prompted, at least in part, by a defendant’s threat to file a challenge at the PTAB. In addition, typically only 10% of patent lawsuits reach the stage at which they receive a claim construction ruling. This 10% figure is in line with our finding that 15.2% of litigated patents are being challenged in the PTAB. It is worth noting that a patent challenged at the PTAB would receive an early claim construction at the institution stage in the IPR/CBM process. That said, we do not imply that the same 10% of patent cases that reach claim construction in district court are also the same patents that are the subject of a challenge at the PTAB.

Our data indicate that patents challenged in the PTAB are, on average, asserted at least three times in court. As Figure 12 indicates, however, this average reflects considerable variation (as shown by the error bars representing one standard deviation of the mean). At least when the group of patents involved in IPR and CBM proceedings is considered as a whole—that is, without disaggregation by technology and district court—the relationship between the number of IPR or CBM petitions that were filed on a patent and the number of times that the patent was asserted in district court is not monotonic. Finally, of course, most patents challenged in district court are not asserted at the PTAB.

To further investigate the relationship between PTAB challenges and Article III assertions, we evaluated a series of measures constructed from the underlying data.

a. IPR and CBM Reviews with Litigation in the Offing

In light of the intended uses of IPR and CBM review as substitutes for federal court litigation, notably, in a number of cases, a given patent was challenged in a PTAB petition before that patent was asserted in litigation. This is a relatively rare occurrence. As of June 30, 2015, 1,968 patents have been the subjects of both a PTAB challenge (either in IPR or CBM) and of district court litigation. Only in fifty-eight of these patents (3.01%) were challenged in district court litigation simultaneously with or after the first PTAB challenge, rather than before.

Their small number notwithstanding, these cases arguably represent a challenge to the standard model of a PTAB challenge as a substitute for ongoing litigation. However, a relatively small variation to that standard model could encompass the case where litigation was actually imminent. In other words, in these circumstances, the filing of a petition in the PTAB was similar to a declaratory judgment action. That is, indeed, what we find. Of the fifty-eight patents that were challenged in the PTAB before any litigation, forty-seven patents (81.0%) were challenged by petitioners who were subsequently named as defendants in federal court litigation over the same patents.

b. IPR and CBM Reviews with No Related Litigation

Another phenomenon that must be reconciled with the standard model is that some patents are challenged in the PTAB but have not been observed in litigation at all, either before or after the
petition for IPR or CBM review. Though a PTAB validity challenge is a reasonable substitute for litigation that has already begun or is imminent, it may be a potentially counterproductive approach for anyone else, particularly in the case of an IPR (where, as contrasted with the CBM review, the petitioner does not have to be charged in any way with infringement), such a challenger might simply raise unwanted attention to its potentially infringing activities. Indeed, IPRs or CBM reviews with no related litigation are a somewhat rare occurrence. As of June 30, 2015, only 324 patents (13.3%) have been challenged in the PTAB with no related litigation observed in the federal courts. But even the existence of such a subset might be considered peculiar.

There are several potential reasons for this unexpected subset. One is statistical censoring: the PTAB challenges are simply so recent that the patent owner has not filed responsive litigation yet, but may do so in the relatively near term. Censoring, however, does not appear to explain the subset fully. Petitions on such “PTAB-only” patents have been filed from the earliest days of IPR and CBM review in September 2012. As of June 30, 2015, 331 petitions have been filed on patents with no related litigation observed, and 158 (47.7%) of those petitions were filed more than one year ago from the present, in or before June 2014. In other words, many of the patent owners have had ample time to bring infringement actions against the petitioners who filed for IPR or CBM review and have not yet done so. So it is still possible, but increasingly unlikely, that a patent owner who has not asserted a patent against an IPR or CBM challenger will do so now.

A second possible reason for this phenomenon is statistical selection, including technology-specific selection: where a PTAB validity challenge is sufficiently strong, and a patent owner’s countervailing infringement claim against the PTAB challenger is sufficiently weak, an invalidity challenge might arise without any corresponding infringement assertion. This kind of selection effect, however, would require that both parties have information ex ante about the relative merits of each other’s case, i.e., about the boundaries and legal viability of the patent in dispute, that is both adequate and roughly symmetric. Such ex ante clarity may be possible for Chemical and Drugs and Medical patents, where technical nomenclature is standardized and the boundaries of the invention are amenable to delineation. Ex ante clarity may even be possible for Electrical and Mechanical patents if the patent discloses sufficiently detailed structural information. However, patents on CCM inventions that are claimed in functional terms would be much less likely to provide enough ex ante clarity that a PTAB challenge would be so plainly strong, and a retaliatory infringement suit so plainly weak, as to produce an IPR or CBM review with no litigation in response.

Additionally, in at least some technology areas, the number of patents that are clearly “important” as a matter of potential litigation risk may be relatively small and easy to identify. Particularly in the context of IPRs (which can be filed even without any assertion of infringement on

---

123 For example, the filing fees for IPR are $9,000 at the petition stage and $14,000 at the post-institution stage. 37 C.F.R. § 42.15(a). The filing fees for CBM review are even higher: $12,000 at the petition stage and $18,000 at the post-institution stage. 37 C.F.R. § 42.15(b). Contemporaneous estimates of average attorney costs were over $130,000. Olga Berson, Challenging Patent Validity Under the AIA: Strategic and Tactical Considerations When Deciding Whether to Pursue Ex Parte Reexamination or Inter Partes Review As Part of the Overall Litigation Strategy, 2012 WL 6636452, *12 (2012).
124 Peter S. Menell & Michael J. Meurer, Notice Failure and Notice Externalities, 5 J. LEGAL ANALYSIS 1, 36 (2013). Indeed, in the case of certain drugs (so-called small molecule drugs), patents asserted to cover the drug are specifically on the FDA “Orange Book.”
the part of the patentee), the high volume of CCM-related patents may make it unclear which patents are most important.

The data are consistent with technology-specific selection effects across the three subsets of (1) patents that were only challenged in the PTAB, (2) patents that were only asserted in litigation, and (3) patents that were both challenged in the PTAB and asserted in litigation as summarized in Figure 13. Comparing PTAB-only patents with district court-only patents, the technology distributions were mostly similar. In both subsets, CCM patents accounted for about a third (32.8% and 37.1%, respectively); Drugs and Medical patents about a fifth (20.6% and 19.7%, respectively); Electrical patents a little less than a seventh (13.9% and 11.3, respectively); and Mechanical patents a little more than a tenth (11.5% and 10.1%, respectively).125 Only Chemical patents occupied a significantly greater share of PTAB-only patents (12.5%) than of district court-only patents (4.9%).126

The most notable difference was for patents that were both challenged in the PTAB and asserted in district court. A majority of these PTAB-and-district-court patents (54.7%) were in the CCM technology area, as compared with 32.8% of PTAB-only patents.127 This underrepresentation of CCM patents in the PTAB-only group is consistent with the expected lower likelihood that CCM patents offer enough ex ante clarity and evidence of importance to produce PTAB challenges in situations where there is no federal court litigation.

Having considered the special cases of PTAB validity challenges that either precede a district court litigation or have no related litigation at all, we now turn to the standard model of PTAB validity challenge as a direct response by a defendant in prior infringement litigation.

c. CBM and IPR Challenges As Direct Self-Interest

As we have discussed, a defendant that challenges a patent’s validity in the USPTO after the patent has been asserted in litigation is the standard use of CBM and IPR petitions. The USPTO’s expertise substitutes for the generalist orientation of the courts. We find that, overall, CBM and IPR petitions are in fact predominantly assertions of the petitioners’ own direct interests with respect to infringement liability on the particular patent being challenged.

In the majority of cases, petitioners for CBM review have previously been defendants in federal court litigation where the same patent was asserted. Two related measures support this finding. One is the share of CBM petitioners (77.9%) who have previously been defendants in district court litigations involving the patents they later challenge in CBM review. The other is the share of CBM petitions (82.7%) in which at least one petitioner was previously a defendant as to the patent now being challenged. These results are perhaps not surprising, as CBM petitions can only be brought by those sued for, or charged with, infringement. Additionally, though it is not particularly meaningful

125 These differences were not statistically significant (p > 0.05 using a two-tailed test of proportions).
126 Conversely, “Other” patents occupied a greater share of district court-only patents (16.9%) than of PTAB-only patents (8.8%).
127 This difference was highly statistically significant (p < 0.0001 using a two-tailed test of proportions).
to speak of technology differences among CBM petitions.\textsuperscript{128} Figures 14a and 14b show that the finding also persists for each NBER technology category.

Similarly, in the case of IPRs, the majority (70\%) of IPR petitioners have previously been defendants in district court litigations involving the patents they now challenge. The remaining 30\% of cases in which petitioners are not prior defendants do, however, represent an interesting puzzle, particularly if one looks across technologies, and also at the percentage of petitions in which at least one petitioner was previously a defendant. We turn next to this puzzle.

d. IPR Challenges by Entities That Were Not Prior Defendants

As Figure 15a shows, the percentage of IPR petitioners who were not prior defendants varies substantially across technologies. Notably, because only about 48\% of petitioners in the Drugs and Medical area have previously been sued, over half of all petitioners in this technology are non-standard. In some cases, generic firms may be filing even prior to being sued in order to clear the path toward eventual entry into the market. In other cases, we know from reading IPR petitions to identify petitioners that third parties have been active in bringing PTAB challenges. One active third party is J. Kyle Bass, the principal of Hayman Capital Management and of the Coalition for Affordable Drugs, who has filed at least twenty-eight petitions.\textsuperscript{129} Another is Erich Spangenberg, the chief executive of the IP Navigation Group and of nXn Partners, who is a co-petitioner on those same twenty-eight petitions.\textsuperscript{130} Both Mr. Bass and Mr. Spangenberg have thus far focused their validity challenges entirely on Drugs and Medical-related patents.

Figures 15a and 15b also reveal substantial disparities in certain technology areas between the share of petitioners who were previously sued and the share of IPR petitions with at least one petitioner who was previously a defendant on the challenged patent. Specifically, the petitioner vs. petition disparities are quite substantial in the categories of Drugs and Medical (48.5\% vs. 70.8\%), Mechanical (53.1\% vs. 70.2\%) and Other (65.5\% vs. 82.6\%). The disparities reveal that, in each of these technology areas, petitioners who are not prior defendants are joining petitions filed by prior defendants.

Arguably, this collective action is socially beneficial, as it directly addresses the general collective action problem in challenging invalid patents.\textsuperscript{131} However, to the extent collective action takes the form of serial petitions that are joined later to the petition of a prior defendant, it could be seen as harassment and delay. Currently, our data does not allow us to determine exactly when non-defendant petitioners are joining the petitions of defendants. PTO regulations do require, however, that a joinder request be filed no later than one month after the institution date of any inter partes review for

\textsuperscript{128} This is because the availability of CBM review is defined, and limited, by technology, and as a result, CCM patents have accounted for 82.2\% of all CBM Petitions, with 15.9\% coming from Mechanical patents and 1.9\% from Other patents. See Figure 6, supra [change to infra and hotlink?].

\textsuperscript{131} See supra text accompanying notes 36-38.
which joinder is requested. In ongoing research, we are parsing the joinder data more finely to look at timing and how the regulations are being applied.

In this regard, it bears mention that fostering collective action is the explicit mission of organizations such as Unified Patents, which files patent validity challenges on behalf of its member companies in order to reduce their patent litigation risk. We expect that, in order to be effective, such member-based organizations would likely file significant numbers of IPR petitions and focus their efforts largely on a single technology area. Unified Patents, for example, has filed at least twenty-four petitions of which seventeen (71%) are against CCM-related patents.

e. Timing Between the Courts and the USPTO

Closely related to the “non-standard” petitioner issue is the question of time lag between Article III assertion and PTAB challenge. Unless the petition includes a request for joinder, a petitioner cannot file an IPR challenge more than a year after it has been sued for infringing a particular patent. As a result, administrative validity challenges filed more than one year after the last federal court lawsuit prior to a petition are likely to reflect either non-standard petitioners and/or petitioners seeking joinder to earlier petitions.

To investigate these issues further, we measured the time lag between the first IPR petition on a given patent and the federal court litigation on that patent filed most recently prior to the first IPR petition. (By definition, the first IPR petition cannot request joinder.) As an additional frame of reference for these results, we calculated the lag between the first IPR petition on a given patent and the earliest observed federal court litigation on that patent. The latter measure takes a broad view of how court-agency lags are distributed and is likely to contain a small, but non-trivial number of instances where the lag is greater than one year. The reason is that, for repeatedly-asserted patents, the first defendant sued need not be the one that mounts a validity challenge in the USPTO.

As Figure 17 shows, quite a few patents fit this latter profile: nearly a quarter of the distribution (23.4%) exceeds the one-year lag from the earliest observed federal court litigation on a given patent, reaching upwards of three years for some patents. Notably, a small share of patents, roughly 3.3%, shows a negative lag indicating the first IPR petition against the patent preceded the first federal court assertion of the patent. For these patents, administrative validity challenges are not defensive in the traditional sense, as no offensive litigation has yet been observed. Rather, they are, at most, preemptive. Most IPR petitions, however, fall within the zero-to-one-year range, distributed symmetrically about a median lag of six months, with a modal spike at the one-year deadline.

Meanwhile, measuring from the last pre-IPR federal court lawsuit to the first IPR petition is likely to capture not only non-standard petitioners but also cases where earlier lawsuits against others have revealed useful information about the patent owner’s enforcement strategy so that less time is needed to decide whether and how to prepare an IPR challenge. This is, in fact, what the data reveal

---

132 37 CFR Section 42.122.
135 As we have discussed, these preemptively-challenged patents may reflect litigation in the offing or else no related litigation. See supra Parts III.A.2.a, III.A.2.b.
in Figure 18. The majority of cases fall again within the zero-to-one-year range, but with a median lag roughly four months less than in Figure 17. A far smaller share of the distribution (11.4%) exceeds one year -- presumably this 11.4% comprises non-standard petitioners only. As before, a modal spike near and at a one-year lag indicates that litigants wait for the statutory deadline.

These direct and indirect measures suggest that challenges to patent validity through inter partes review are primarily—though not exclusively—a defensive response to existing litigation. In most cases, a prior defendant files an administrative challenge. Other entities, acting on this revealed information, may also respond with petitions for validity review.

We now turn to another aspect of strategic behavior in patent litigation that has previously presented policy concerns: the tendency of patent cases to be filed disproportionately in a few judicial districts, so much so that these districts are now widely identified with patent litigation.

f. District-Specific Effects

The skewed distribution of patent litigation toward particular high-volume judicial districts and litigant forum-shopping, which not only results from this skew but also contributes to it, are well documented. It is likely, then, that such leading patent courts should send commensurately greater numbers of patents into PTAB validity challenges as well. Yet in this regard, the data show a surprising effect. Of the eight leading district courts—which together account for nearly 70% of litigated patents during the observed time period—the top three courts were overrepresented in sending patents into PTAB validity challenges, and the remaining five were underrepresented.

Figure 16 depicts the fraction of all litigated patents that were litigated at least once in a given court and the fraction of all IPR-challenged patents that were litigated at least once in the same court, across the top eight districts for patent litigation. The latter fraction was significantly higher than the former for the District of Delaware (41.1% vs. 34.4%), the Eastern District of Texas (41.4% vs. 28.5%), and the Northern District of California (21.6% vs. 15.2%), indicating that patents litigated in those districts were unusually likely to be challenged in inter partes review. The effect was reversed for the other high-volume patent districts, including the Central District of California (14.1% vs. 16.0%), the District of New Jersey (10.0% vs. 13.0%), and the Northern District of Illinois (4.8% vs. 9.6%).

The great disparity we see in the Eastern District of Texas is unsurprising—the court’s strong pro-patentee reputation would be expected to drive defendants to a more strategically favorable forum. This effect is likely in spite of the apparently low likelihood of defendants either filing or being granted stays in the Eastern District of Texas. In the cases of the District of Delaware and the Northern District of California, the reasons for disproportionately high IPR filings are less clear.

136 See generally notes 28-33 and accompanying text.
137 These differences were highly significant (p < 0.0001 using a two-tailed test of proportions).
138 These differences were all significant as well (p < 0.05 using a two-tailed test of proportions).
139 See, e.g., Vishnubhakat, supra note 30, at 65 (discussing the reputation of the Eastern District of Texas for producing pro-patentee outcomes).
Defendants in those districts may be encouraged, however, by the high rate of stay grants in these districts.\textsuperscript{141}

B. AGENCY DECISIONS

When petitioned, the PTAB must decide whether to institute an IPR or CBM review on the grounds petitioned. If it decides to institute, the PTAB must then adjudicate the case on its merits. Decisions on institution and on the merits are interdependent in that the legal standard for instituting an IPR is whether the petitioner is reasonably likely to succeed as to at least one claim, and the legal standard for instituting a CBM review is whether the petitioner is more likely than not to prevail as to at least one claim.\textsuperscript{142} Therefore, the rates of institution are particularly important because the very fact of institution is, by statutory design, a credible signal about the ultimate outcome of the validity challenge.

In the case of IPR, an early study found petitions on which the USPTO had decided to institute or not (823 IPR petitions at the time), 84.0\% were granted as to at least one challenged claim.\textsuperscript{143} Further-updated data confirms this point estimate but reveals a slow and consistent decline in the institution rate. Figure 19 compares over time (1) the running total number of IPR petition filings, (2) the running total number of institution decisions, and (3) the running total number of institution decisions granting at least one challenged claim. Calculating the institution rate as (2) divided by (3) over time, Figure 20 shows that the rate has been declining and is currently at 74.8\%.

The earlier study also found that 74.0\% of at-least-partially instituted petitions were fully instituted. Our data conflict on this point. We find that 51.4\% of at-least-partially instituted petitions were fully instituted\textsuperscript{144} and, more relevantly, that 38.4\% of petitions that received an institution decision were fully instituted. These trends are summarized in Figure 21.

In addition to general institution rates, we also disaggregate institution rates by technology area and by the grounds on which patent validity was challenged. Figure 22 shows the rates at which institutions are granted and denied across technologies for petitions arguing a lack of novelty. Petitions on Drugs and Medical-related patents have a 59.9\% likelihood of being denied,\textsuperscript{145} and in all other technologies, petitions are as likely as not to be instituted (p > 0.05). Figure 23 shows the rates at which institutions are granted and denied across technologies for petitions arguing a lack of nonobviousness. Perhaps not surprisingly, given the ability of expert judges to combine multiple references, nonobviousness petitions are more likely than not to be instituted across all technology

\textsuperscript{141} Id.
\textsuperscript{142} See supra notes 91, 110 and accompanying text. A CBM review may also be instituted for policy reasons. See supra note 111 and accompanying text.
\textsuperscript{143} Love & Ambwani, supra note 2, at 100.
\textsuperscript{144} In order to compare rates of partial and full institution, we keep consistent the denominator of petitions that have received an institution decision whereas the Love-Ambwani study reports full institution as a fraction of partial institution. By that measure, too, our findings differ: we find that 41.2\% of at-least-partially instituted petitions were fully instituted, not 74.0\%. This discrepancy controls for the amount of data available at the time of the earlier study—roughly the end of March 2014, when 843 institution decisions had been made and 699 petitions had been at-least-partially instituted.
\textsuperscript{145} The differences between respective likelihoods of grant and denial are highly significant (p < 0.001 using a two-tailed test of proportions).
areas. Nonobviousness challenges to Chemical patents are particularly likely to be granted, with an institution rate of 68.5%.  

Meanwhile, for CBM petitions, comparing technology categories is not particularly meaningful, as the definition of covered business method patents in practice overlaps substantially with CCM-related patents. Instead, because CBM review allows the full range of legal grounds on which to challenge validity and because petitioners themselves have availed themselves of these grounds to varying degrees, comparing the rates at which CBM petitions have been instituted with respect to each of these grounds is more meaningful.

Figure 7 previously showed that subject-matter eligibility under § 101, novelty under § 102, and nonobviousness under § 103 were the major grounds on which CBM petitions have been filed whereas the enablement, written description, and definiteness requirements of § 112 have been employed relatively infrequently. Because CBM review arose out of categorical resistance to business methods as patent-eligible subject matter, and inception of CBM review coincided with Supreme Court decisions substantially strengthening patent eligibility requirements, we expected that subject-matter challenges would be the most fertile ground for decisions to institute CBM petitions. We expected that the remaining grounds would be likely to garner fewer PTAB institutions, though in the particular case of nonobviousness, the higher standard imposed by the Supreme Court’s 2007 decision in KSR Int’l Co. v. Teleflex Inc. might have an impact.

Figure 24 confirms our hypothesis that subject matter eligibility would dominate the CBM procedure. Subject matter eligibility-based CBM petitions are overwhelmingly instituted, at a rate of 70.9%. For all other grounds, decisions not to institute predominate by large margins: challenges based on novelty were denied at a rate of 59.3%; nonobviousness, 56.9%; enablement, 100%; written description, 71.7%; and definiteness, 64.7%.

C. COURT DECISIONS

While the USPTO evaluates and decides invalidity petitions, federal courts must decide how to manage ongoing patent infringement litigation on which these validity challenges can have considerable impact. The most frequent decision for courts is when to issue a stay. The ability of defendants to obtain litigation stays pending the outcome of validity challenges is a powerful strategic consideration in managing both the immediate cost of litigation and the eventual threat of liability. Conversely, the tendency of courts to grant such stays is a powerful strategic consideration for patent owners to enforce their rights effectively and deflect potential harassment and abuse by challengers.

146 The differences between respective likelihoods of grant and denial are significant (p < 0.05) for Mechanical-related petitions, and highly significant for all other technologies (p < 0.005). Comparisons use a two-tailed test of proportions.  
147 See 35 U.S.C. § 315(a)(2); Frontz, supra note 102; supra note 107.  
148 See supra Figure 7 [infra?], Proportions of CBM Petitions Containing Each Grounds for Challenge.  
150 The difference between likelihoods of grant and denial is highly significant (p < 0.0001 using a two-tailed test of proportions).  
151 The differences between likelihoods of grant and denial were all significant (p < 0.05) and in many cases highly significant (p < 0.005) using a two-tailed test of proportions.
The tables below provide basic statistics regarding motions for stays pending IPR and CBM proceedings, as well as federal court adjudications of such motions. As the statistics indicate, full denials of motions to stay (as contrasted to the combined total of “denials without prejudice,” partial grants, and grants) are relatively rare, particularly in the context of CBM reviews.

IV. DISCUSSION

Our analysis yields several “top-line” findings regarding strategic choices by parties in PTAB proceedings. Most patents challenged at the PTAB are also in Article III litigation. PTAB petitions on patents that are not being litigated in an Article III court are relatively rare. Moreover, the standard substitution model is operative in the majority (70%) of PTAB cases: that is, most petitioners file a patent challenge after they have previously been sued on that patent in district court. The prevalence of standard substitution has obvious implications for how PTAB should conduct claim construction. In those cases where a patent claim is upheld by the PTAB, a claim construction standard that parallels that of the district court would presumably increase efficiency, as the district court could simply rely on the PTAB claim construction for purposes of its infringement determination.

If there is no Article III litigation, CCM patents are particularly unlikely to be challenged at the PTAB. In this area of technology, district court assertion may be necessary to force parties to overcome several technology-specific barriers to a petition. These barriers may include an absence of clarity regarding the merits of a validity challenge created by a lack of patent boundary notice as well as informational hurdles created by the sheer volume of CCM patents.

Just as Article III litigation disproportionately accompanies PTAB petitions on CCM patents, IPR petitions in the CCM field appear to be brought largely by the same entities that are defendants in Article III litigation. Both the share of CCM petitions involving at least one prior Article III defendant (81.5%) and the share of CCM petitioners who are themselves prior defendants (76.3%) are quite high. This result suggests that non-standard petitioners are, at least thus far, playing a relatively modest role in IPR petitions brought against CCM patents. Thus, to the extent we see a substantial amount of serial petitioning in the CCM area, this is being generated by prior defendants.

The most significant role for non-standard petitioners is in the Drugs and Medical area. For Drugs and Medical-related challenges, previously sued defendants make up only a minority of petitioners (48.5%). Non-standard petitioners also appear to be engaging in significant collective action with standard petitioners. A substantial majority (70.8%) of petitions in this area contains at least one petitioner who has previously been sued. Litigation defendants in the Drugs and Medical field are clearly bringing aboard entities that have not yet been sued. In order to address policy implications (e.g., whether it is socially beneficial collective action or possible harassment), we are currently investigating the important policy question of precisely when these other entities are getting on board.

In addition to technology-specific effects, we see district-specific effects. To a statistically significant degree, patents litigated in the “top three” district courts—the Eastern District of Texas, the District of Delaware, and the Northern District of California—are more likely to be the subject of an IPR than patents litigated in other districts. The statistically and numerically significant results for the Eastern District of Texas are unsurprising. Whether or not judges in the Eastern District grant stays for ongoing litigation (and the available data suggests defendants are less likely to seek or be granted stays than in other districts), the Eastern District’s “pro-plaintiff” reputation makes filing a PTAB petition an obvious choice for any defendant. In the case of Delaware and the Northern District of California, the reasons for disproportionately high IPR filings are less clear. Defendants in those districts may be encouraged, however, by the high rate of stay grants in these districts.
Agency decision-making also exhibits some interesting patterns. Perhaps because high early rates of institution spurred petitioners to challenge somewhat stronger patents, the overall institution rate has decreased over time. Agency decision-making also exhibits differential patterns across technology: specifically, IPR institution rates are significantly higher for CCM patents than for Drugs and Medical patents. Meanwhile, nonobviousness represents a stronger ground for securing a favorable institution decision on an IPR than novelty. As for CBM reviews, § 101 is clearly the best route for challengers.

Not least, our findings have important implications for the structural dispute now pending before the Supreme Court in *Cuozzo Speed Technologies v. Lee*. The significant degree of standard-model substitution that we identify between the PTAB and the federal courts suggests that the PTAB should ensure that litigants can reliably turn to administrative process in lieu of judicial process for adjudicating the validity of patents without risking substantively conflicting outcomes. Likelihood of such conflict, however, is precisely what the PTAB has created by construing patent claims under a “broadest reasonable interpretation” standard rather than the “plain and ordinary meaning” standard used in the federal courts. The upshot of this divergence is that when the PTAB determines what patent claim terms mean—in order to evaluate whether those patent claims are valid—the PTAB gives those claims a broader meaning than the courts would, leading to a greater likelihood of finding validity problems than would occur in the courts. *Cuozzo* explicitly challenges this structural asymmetry between the administrative and judicial processes, and our findings suggest that the PTAB should, indeed, conduct its ex post review procedures under a claim construction standard that mirrors that of the federal courts.

In current ongoing work, we are investigating both more intensively and more formally the interrelated questions of collective action and potential harassment. Specifically, we are investigating the precise nature and timing of the collective action being undertaken both by petitioners that are prior defendants and those that are not prior defendants. We are also interested in whether non-defendant petitioners do in fact become defendants at a later point in time. Finally, we are exploring any effect the introduction of PTAB proceedings (and the corresponding threat of a PTAB challenge) may have had on settlement behavior in Article III cases.

V. CONCLUSION

Our data indicate that the standard model of prior district court defendants bringing PTAB petitions on the patents for which they have been sued explains the vast majority of PTAB cases. PTAB-only cases are relatively rare, and particularly rare in the case of Computers and Communication (CCM) patents. Given the dominant existence of prior federal district court litigation in the case of patents challenged through IPRs and CBMs, the PTAB should consider the importance of adjudicating patent validity without risking substantively conflicting outcomes. Our findings suggest that the PTAB should conduct its post issuance review procedures under a claim

---

152 No. 15-446 (Sup. Ct., Dec. 18, 2015).
153 37 C.F.R. 42.100(b).
construction standard that mirrors that of the federal courts, as opposed to the broadest reasonable interpretation standard.

That said, a significant minority of IPRs are being brought by entities that are not prior defendants in lawsuits over the patents that they are now challenging. In ongoing research, we are examining the precise role of these non-standard petitioners to examine whether they are engaging in beneficial collective action or in non-beneficial harassment.

Finally, at least thus far, the relative reluctance of the Eastern District of Texas to grant stays does not appear to have impeded entities’ disproportionate desire to seek IPRs for patents asserted in the Eastern District. Perhaps more surprisingly, patents asserted in the Northern District of California and in the District of Delaware also see a disproportionate number of IPR petitions.
APPENDIX A: DATA

Our analysis can be replicated using data from DocketNavigator, which provides free and low-cost access to coded metadata about patent cases in the U.S. federal courts and the USPTO Patent Trial and Appeal Board. In this Appendix, we describe the DocketNavigator data with the understanding that other researchers can readily access it to replicate our study.

A. PTAB DATA

DocketNavigator’s search interface allows minimal queries that can yield large result sets. Thus, to obtain all case information on all petitions filed in the PTAB, we used only one search term: “Patent Trial and Appeal Board (PTAB)” for the “Court/Agency” field. Because the total number of PTAB cases in the DocketNavigator database recently passed 4,000 and search results are displayed one hundred at a time, the results are distributed across forty pages. Detailed party information about cases is bulk-downloadable on a page-by-page basis, i.e., each download contains detailed party information about the cases displayed on the given page of results. Similarly, detailed information about the patents involved in the cases is bulk-downloadable on a page-by-page basis as well. Both sets of case information include multiple variables:

<table>
<thead>
<tr>
<th>Party Information</th>
<th>Patent Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>• case name</td>
<td>• case name</td>
</tr>
<tr>
<td>• court abbreviation</td>
<td>• court abbreviation</td>
</tr>
<tr>
<td>• case number</td>
<td>• case number</td>
</tr>
<tr>
<td>• case filing date</td>
<td>• case filing date</td>
</tr>
<tr>
<td>• party name</td>
<td>• patent</td>
</tr>
<tr>
<td>• party roles</td>
<td>• patent title</td>
</tr>
<tr>
<td>• firm name</td>
<td>• parties</td>
</tr>
<tr>
<td>• attorney name</td>
<td>• USPTO class codes</td>
</tr>
<tr>
<td></td>
<td>• Cooperative patent class codes</td>
</tr>
</tbody>
</table>

Importantly, case-identifying variables appear in both sets of downloads, allowing them to be merged. To construct our data set, we downloaded this detailed party information as well as patent information for all PTAB petitions and merged them by PTAB case number. The merged results yielded a comprehensive set of filing, party, and patent information for each IPR and CBM review petition at the PTAB.

In addition to petition data, DocketNavigator provides searchable data on PTAB institution decisions. As the earliest PTAB institution decisions came in December 2012, a date-based search for decisions issued on or after November 1, 2012 (or any similarly early date), returns a set of all decisions. As with petition data, these results are accessible one hundred at a time on a page-by-page basis. To this end, the “Print Friendly” feature in the search result interface generates a simple

formatted table to copy directly into spreadsheet software. The institution decision data contains the following variables:

<table>
<thead>
<tr>
<th>Institution Decision Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>• patent number</td>
</tr>
<tr>
<td>• case name</td>
</tr>
<tr>
<td>• case number</td>
</tr>
<tr>
<td>• substantive ground for petition</td>
</tr>
<tr>
<td>• institution decision on that ground</td>
</tr>
<tr>
<td>• relevant patent claims to which the decision pertains</td>
</tr>
<tr>
<td>• order filing date</td>
</tr>
</tbody>
</table>

Finally, DocketNavigator provides searchable data on final determinations by the PTAB. Searching for “Patent Trial and Appeal Board (PTAB)” in the “Court/Agency” field returns a set of all determinations. These results, too, are accessible one hundred at a time on a page-by-page basis and available in a simple formatted table through the “Print Friendly” feature in the search result interface. The final determinations data contains the following variables:

<table>
<thead>
<tr>
<th>Final Determination Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>• patent number</td>
</tr>
<tr>
<td>• case name</td>
</tr>
<tr>
<td>• case filing date</td>
</tr>
<tr>
<td>• determination</td>
</tr>
<tr>
<td>• judge</td>
</tr>
<tr>
<td>• order filing date</td>
</tr>
</tbody>
</table>

Because this institution decision data and final determination data also contain case-identifying variables that overlap with the filing, party, and patent data, we readily merged this additional information into our data set as well.

B. DISTRICT COURT DATA

We obtained case information on patent litigations filed in the U.S. district courts with a similarly minimal search query in DocketNavigator’s primary search interface: “U.S. District Courts (and all districts)” for the “Court/Agency” field. The total number of patent cases in the DocketNavigator database exceeded 55,000 results. Because IPR petitions are generally time-barred one year from the date when a would-be petitioner has been sued on the same patent in U.S. district court,\(^\text{156}\) we determined that a reasonably complete set of federal patent litigation would not need to extend more than one year before the IPR mechanism became available. Therefore, we narrowed our

\(^{156}\) 35 U.S.C. § 315(b).
search to cases, other than declaratory judgment cases, filed on or after September 16, 2011, one year prior to the enactment of IPR and CBM review mechanisms in the PTAB.

As with PTAB cases, detailed party and patent information about U.S. district court patent cases is bulk-downloadable on a page-by-page basis. Both sets of case information include multiple variables:

<table>
<thead>
<tr>
<th>Party Information</th>
<th>Patent Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>case name</td>
<td>case name</td>
</tr>
<tr>
<td>court abbreviation</td>
<td>court abbreviation</td>
</tr>
<tr>
<td>case number</td>
<td>case number</td>
</tr>
<tr>
<td>case filing date</td>
<td>case filing date</td>
</tr>
<tr>
<td>party name</td>
<td>patent</td>
</tr>
<tr>
<td>party roles</td>
<td>patent title</td>
</tr>
<tr>
<td>firm name</td>
<td>parties</td>
</tr>
<tr>
<td>attorney name</td>
<td>USPTO class codes</td>
</tr>
<tr>
<td></td>
<td>Cooperative patent class codes</td>
</tr>
</tbody>
</table>

To construct our data set, we downloaded this detailed party and patent information for all relevant patent lawsuits and merged them on the case number, producing a comprehensive set of filing, party, and patent information on each patent lawsuit in the U.S. district courts.
